## **PSSA: The Pennsylvania System of School Assessment**

The purposes of the 2006 statewide assessment component of the Pennsylvania System of School Assessment, as specified in the Chapter 4 Regulations, include providing:

- (1) an understanding of the students' achievement of the academic standards to students, parents, educators and community citizens,
- (2) a measure of the degree to which school programs enable students to attain the academic standards,
- (3) results to school districts, charter schools and Area Vocational Technical Schools, Intermediate Units, Private Residential Rehabilitative Institutions, Approved Private Schools, non-public and private schools for use in their strategic plans,
- (4) information to the general public and state policymakers regarding school achievement of the academic standards, and
- (5) aggregate results for all students and in compliance with federal No Child Left Behind regulations, disaggregated results for various demographic and special needs groups.

The broad purpose of the State Assessments is to provide information to teachers and schools to guide the improvement of curricula and instructional strategies to enable students to achieve the academic standards. The areas assessed in 2006 were mathematics and reading at grades 3-8 and 11 and writing at grades 5, 8, and 11. *The Department strongly discourages the use of this testing information for “ranking” schools.*

## **Item Analysis**

### **Multiple-Choice Items**

Although all items had been reviewed several times prior to testing, a thorough item analysis was conducted to ensure that the items and forms performed as expected. In general, *more able*<sup>1</sup> students are expected to pass easy items, and *less able* students are expected to fail difficult items. If either of these situations does not occur, the item should be reviewed once more to determine the nature of the problem and the characteristics of the students affected.

The most familiar indices of item performance are those that reflect item difficulty (e.g., *proportion correct*, generally referred to as a “p-value”) and those that reflect item discrimination (often represented by the *point-biserial correlation* coefficient). The point-biserial coefficient will be positive if the total test mean score is higher for the students who respond correctly to the item than for the students who respond incorrectly.

The p-value is a subtler indicator of item quality, but the value should be appropriate for the item. If there is a *more able* way to miss an item, the item will appear more difficult than seems warranted given the skill set required to answer the item correctly. Conversely, if there is a *less able* way to pass the item, the item may appear surprisingly easy.

---

<sup>1</sup> Following the Rasch literature, *ability* is used in this discussion as a generic term for the construct that is being measured by the exam. *Competence, achievement, learning and status* are among the alternatives that are sometimes used, but are all subject to some degree of misinterpretation.

The item-level analyses done for the grade 12 retest also included the percent of students selecting each incorrect response (distractor). This information is useful for understanding the item's behavior. The percent selecting each response is an indicator of which responses are particularly attractive. Item level statistics for the multiple-choice items for Mathematics, Reading, and Writing can be found in Appendices A, D, and G, respectively. In the appendices, the "-" code denotes an omit and the "\*" code denotes multiple marks.

### ***Constructed-Response Items***

The first statistics that should be examined when addressing the quality of constructed-response items is the score-point distribution. An examination of the score-point distribution (percentages of students in each scoring category) can provide a rough "snap shot" of an item's quality. For example, a four-point constructed-response item with a vast majority of students receiving *ones* and *fours* with virtually no scores occurring in between would be considered highly suspect. Item level statistics for the constructed-response items for Mathematics, Reading, and Writing can be found in Appendices C, F, and I, respectively. In the appendices, the "B" code denotes a blank non-response, the "F" code denotes a response in a foreign language, the "K" code denotes an off-task response, and the "U" code denotes an unreadable response.

### ***Raw-to-Scaled Score Conversions***

A *Scaled Score*, in the simplest sense, is a transformed number-correct score. This transformation is done in two steps. First, there is a nonlinear transformation that converts number-correct scores—or, in the case of tests with differentially-weighted items, the total number of points attained—to logits, and then there is a linear transformation to convert logits to scaled scores. When all students take the same items, as in the common sections of the PSSA (or all items on the grade 12 fall retest), higher number-correct scores are associated with higher scaled scores.

Scaled scores have several interpretive advantages over raw scores, as illustrated in the following example. A raw score of, for instance, 30 is almost meaningless unless the reader is also told how many points were possible. The same score has quite different meaning if it is based on a thirty-item test or on a sixty-item test. *Total points attained are transformed to percent correct scores to remove the effect of test length.* In the same way, a score based on sixty *difficult items* is quite different from the same score based on sixty *easy items*. *Total points attained are transformed to scaled scores to remove the effects of test length and item difficulty.*

Table 1 describes the equations used to transform the logit scores to the scaled scores.

**Table 1: Logit-to-Scaled Score Conversions**

<b>Subject</b>	<b>Transformation</b>
Mathematics	$206.42X + 1203.1$
Reading	$245.45X + 1115.2$
Writing	$100.01X + 1244.32$

To maximize their utility, scaled scores need to be placed in a meaningful context. A temperature of 37 degrees does not provide useful information unless the scale is anchored to some known point. In this context, some useful anchors might be the freezing point of water or perhaps the normal body temperature of humans. To be meaningful, the new metric must be related to known

objects and situations—in other words, some sort of *measurement standard*. Subsequent sections of this report provide descriptions of the results in the context of these *performance standards* and in terms of scaled scores.

## **Summary of the Grade 12 Retest Results**

Students in the twelfth grade are allowed a final opportunity to improve their status with respect to the Advanced/Proficient certification for Reading, Mathematics, and Writing. This opportunity is provided through a special fall administration of the PSSA. The 2006 retest consisted of the common sections from the 2006 grade-eleven spring administration, and therefore, the raw-to-scaled score conversion tables were available prior to the fall testing. While this was true for reading and mathematics, the raw-to-scaled score conversion tables for writing had to be adjusted due to the replacement of one of the writing prompts. The RS-SS tables for Mathematics, Reading, and Writing can be found in Appendices K, L, and M, respectively.

Students performed less well on the retest than students who took the tests the previous spring in all three content areas. These results are to be expected in a retest situation because the group taking the retest is typically comprised of students who have performed poorly on the previous administration. In this report, results from all fall retest students are compared with results from all spring operational retest students. The two distributions do not entirely overlap due to the presence of students who took the fall retest but did not take the spring operational test.

In addition to the mean scores being lower for the retest group than for the spring group, the standard deviations are also lower. Smaller standard deviations are the result of a more homogeneous score distribution, an artifact of the aforementioned tendency for retesters to be lower achieving students. The relatively lower test reliabilities (based on Coefficient Alpha) for Reading and Mathematics can also be attributed to the decreased variability in test scores. Reliabilities for the Writing inventory are given in the form of stratified alpha coefficients.

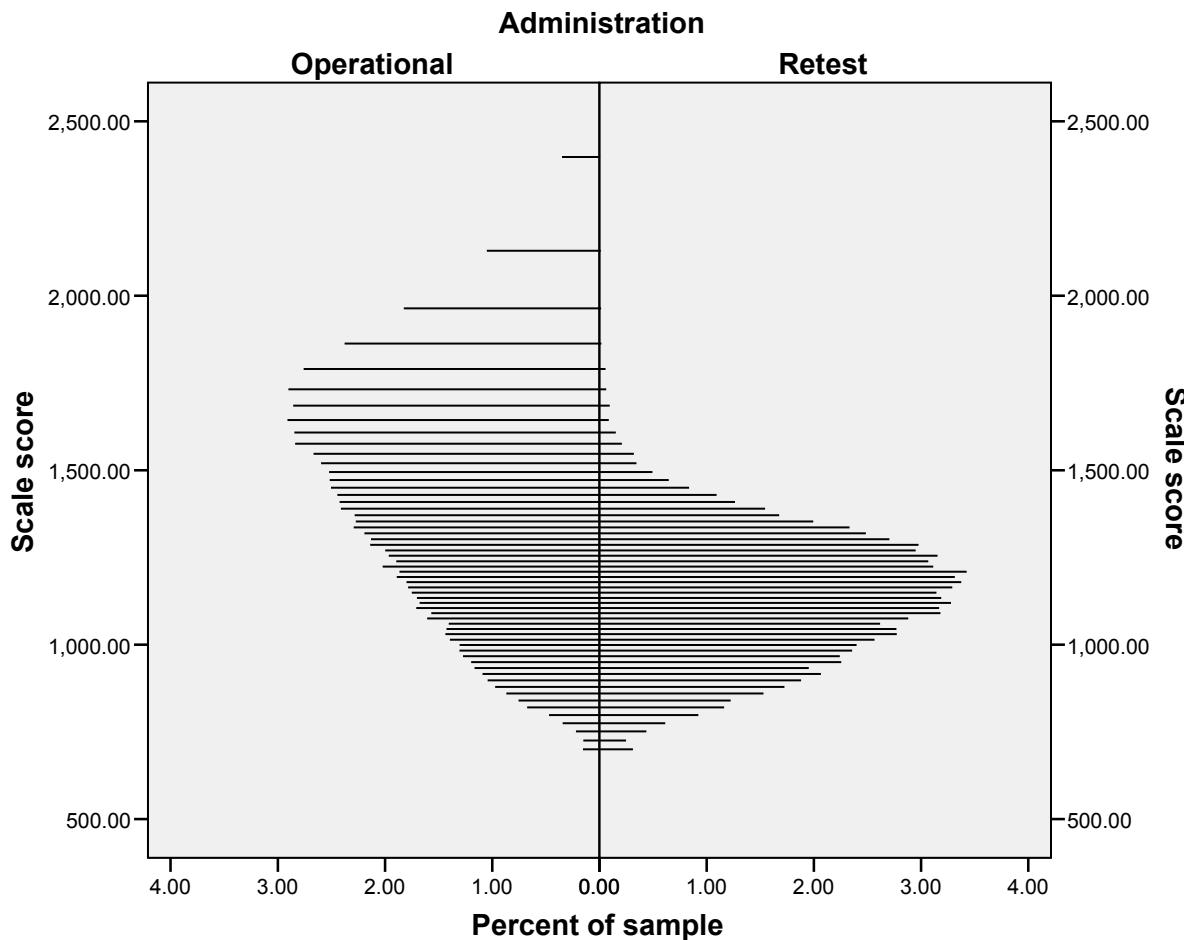

**Table 2: Operational and Retest Summary Statistics (Scaled Score Metric)**

	Mathematics		Reading		Writing	
	Operational	Retest	Operational	Retest	Operational	Retest
<b>Count</b>	134411	33399	134083	22783	132210	7621
<b>Mean</b>	1341	1138	1365	1149	1514	1234
<b>Std. Deviation</b>	293	173	279	201	275	210
<b>Minimum</b>	700	700	700	700	700	700
<b>Maximum</b>	2398	2398	2631	2317	2356	2317
<b>Reliability</b>	0.94	0.88	0.90	0.79	0.79	0.79

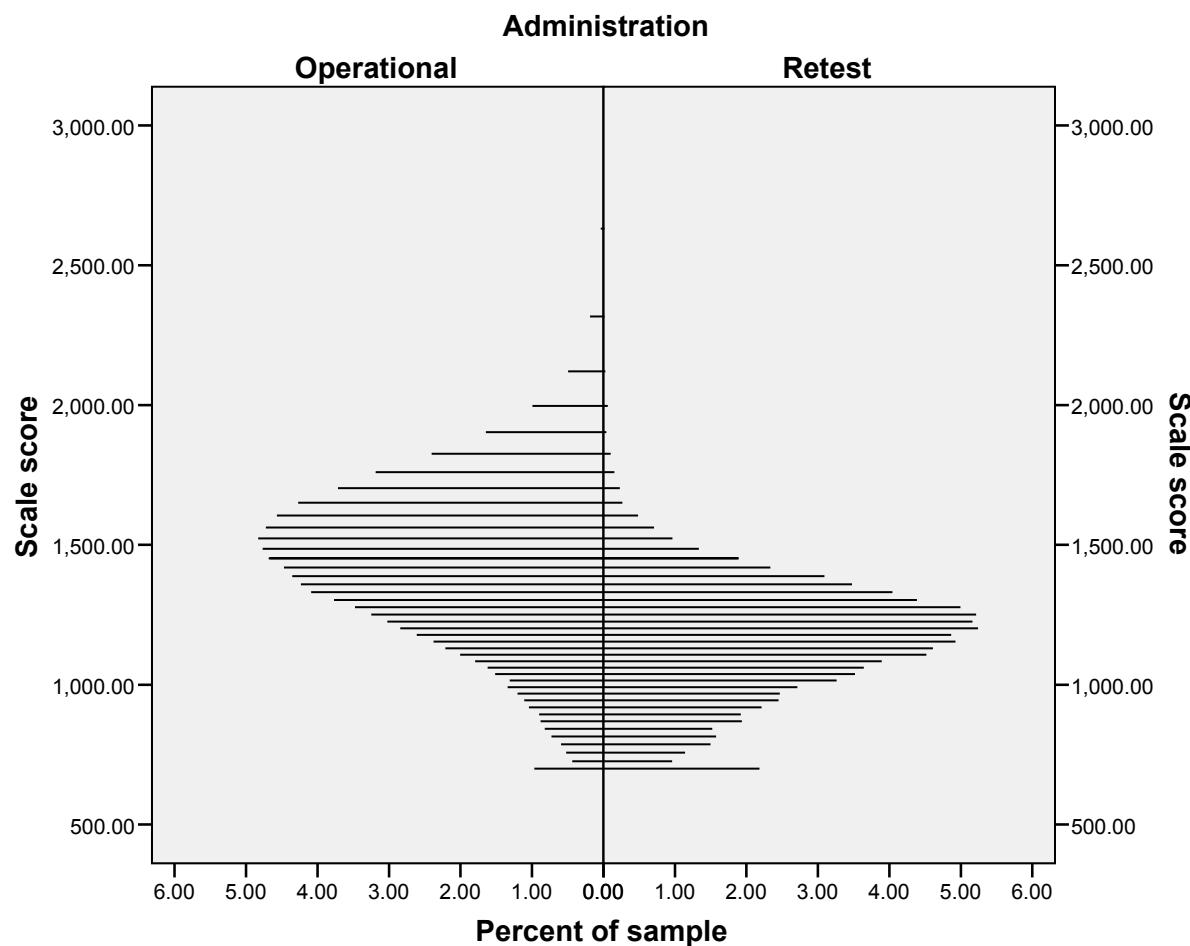

In 2002, a minimum scaled score of 700 was implemented for all PSSA Reading, Mathematics and Writing exams. Because of the truncation created by having a lowest obtainable scale score, it is possible for several of the lowest raw scores to convert to a scaled score of 700. Because very few students are in this region of the score distribution (which does not include any cut scores) this policy has minimal effect on the overall score distribution and performance level percentages. More details on the scores can be found in the raw-to-scaled score conversion tables in the appendices.

Figures 1, 2, and 3 show the frequency distributions for fall retest Reading, Mathematics and Writing test scores, respectively. All figures reflect the same information shown in Table 1: generally positively-skewed score distributions with lower test scores occurring with much greater frequency than higher scores. For reference purposes, these plots also illustrate the spring operational frequency distributions against the fall frequency distributions.

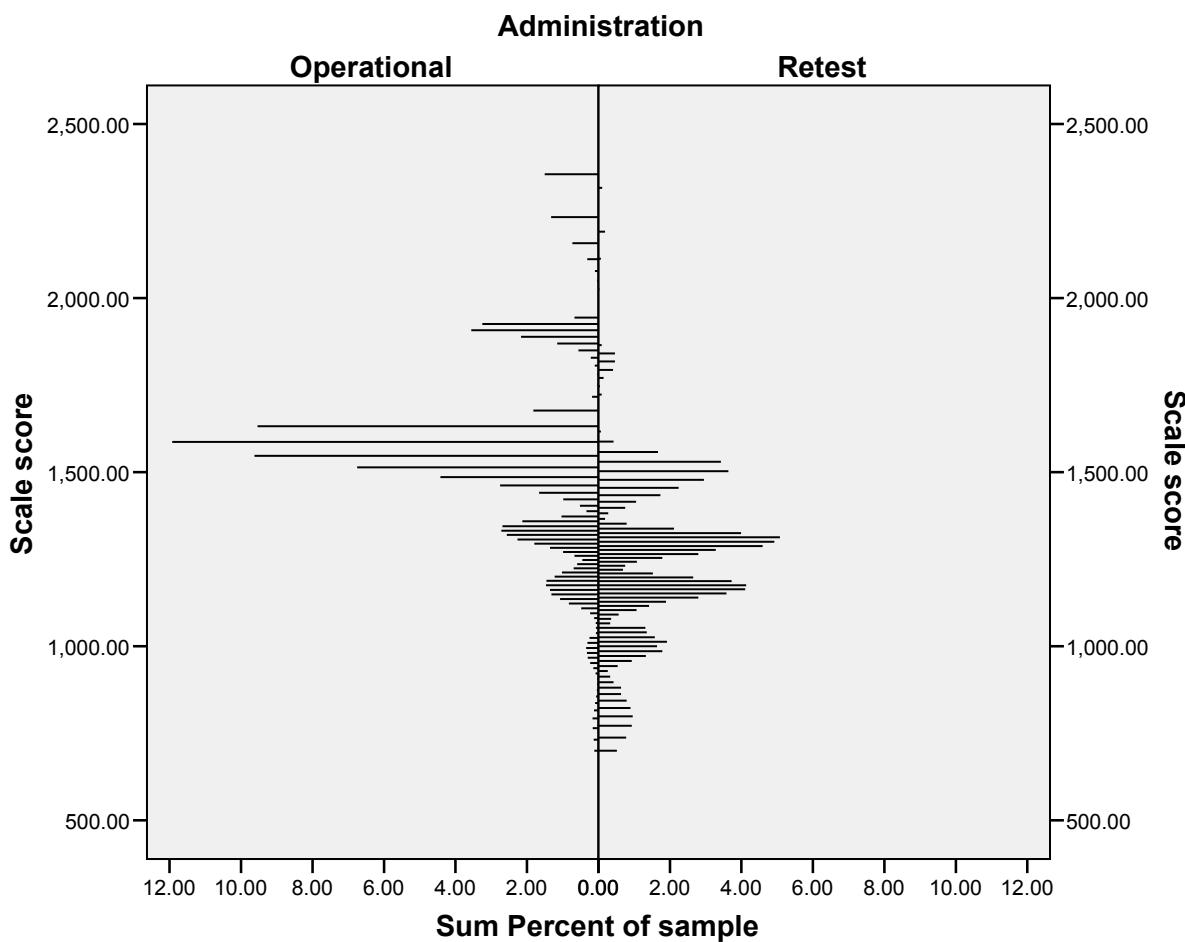

**Figure 1: Mathematics Operational and Retest Scaled Score Frequency Distribution**

**Figure 2: Reading Operational and Retest Scaled Score Frequency Distribution**

**Figure 3: Writing Operational and Retest Scaled Score Frequency Distribution**

In Writing both the operational and fall distributions have a ‘roller-coaster’ pattern with a major mode and several minor modes. This pattern likely results from the weighting given to the writing prompts in scoring. This is described in the Spring Technical Report for Writing.

## **Performance Level Results**

In order for scaled scores to be meaningful to the reader, they must be related to some sort of performance standards. The Commonwealth of Pennsylvania has developed four general Performance Level Descriptors, which are described in Table 3.

**Table 3: Performance Level Descriptors**

<b>Level</b>	<b>Description</b>
<b>Advanced</b>	The Advanced Level reflects superior academic performance. Advanced work indicates an in-depth understanding and exemplary display of the skills included in the Pennsylvania Academic Content Standards.
<b>Proficient</b>	The Proficient Level reflects satisfactory academic performance. Proficient work indicates a solid understanding and adequate display of the skills included in the Pennsylvania Academic Content Standards.
<b>Basic</b>	The Basic Level reflects marginal academic performance. Basic work indicates a partial understanding and limited display of the skills in the Pennsylvania Academic Content Standards. This work is approaching satisfactory performance but has not yet reached it. There is a need for additional instructional opportunities and/or increased student academic commitment to achieve the Proficient Level.
<b>Below Basic</b>	The Below Basic Level reflects inadequate academic performance. Below Basic work indicates little understanding and minimal display of the skills included in the Pennsylvania Academic Content Standards. There is a major need for additional instructional opportunities and/or increased student academic commitment to achieve the Proficient Level.

The scores that correspond with each performance level are located in Table 4. The cumulative percentage of students who achieved a Proficient or Advanced performance level for Mathematics, Reading and Writing are 15.8, 28.5 and 50.9, respectively. The scores indicate that approximately 50%-85% of the students who took the retest still scored in the Basic or Below Basic levels for each subject level.

**Table 4: Grade 12 Retest Performance Standards**

<b>Mathematics</b>			
<b>Performance Level</b>	<b>Scaled Score</b>	<b>Frequency</b>	<b>Percent in Category</b>
<b>Advanced</b>	1509 and up	461	1.4
<b>Proficient</b>	1304-1508	4798	14.4
<b>Basic</b>	1167-1303	9377	28.1
<b>Below Basic</b>	1166 and below	18762	56.2

<b>Reading</b>			
<b>Performance Level</b>	<b>Scaled Score</b>	<b>Frequency</b>	<b>Percent in Category</b>
<b>Advanced</b>	1492 and up	693	3.0
<b>Proficient</b>	1257-1491	5817	25.5
<b>Basic</b>	1112-1256	6838	30.0
<b>Below Basic</b>	1111 and below	9434	41.4

<b>Writing</b>			
<b>Performance Level</b>	<b>Scaled Score</b>	<b>Frequency</b>	<b>Percent in Category</b>
<b>Advanced</b>	1806 and up	107	1.4
<b>Proficient</b>	1236-1805	3775	49.5
<b>Basic</b>	952-1235	3155	41.4
<b>Below Basic</b>	951 and below	583	7.7

Of the students with scores for both the spring operational and the fall retest administrations, 63.7% of the students remained at the same performance level in Mathematics, while 25.5% transitioned to a higher level and 10.9% regressed to a lower level. (Numbers may not add to 100% exactly due to rounding.) For Reading, 49.9% of the students stayed at the same level, 38.8% improved and 11.3% regressed. For Writing, 44.6% of the students remained at the same level, 49.3% improved and 6.1% regressed.

Writing had the greatest improvement in terms of positive performance level shifts. The Pennsylvania Department of Education previously established the policy that any student with a raw score within 3 points of the minimum required for proficiency should be rescored. The final Writing score for these students would be the higher of the two scorings. The distribution of scaled scores after the rescoreing is shown in Figure 3. (Percentages of exact and adjacent agreement from hand scoring can be found in Appendix J.) This scoring policy might account for part of the success of the writing retesters. Additionally, as mentioned earlier, the writing prompt scores are weighted heavier than the MC item scores. Thus, improvement on the weighted portions of the writing test might have further facilitated the retest gains.
