Stress Testing Analysis

February 2024

Agenda

I. Project Overview

II. Scenario Analysis

III. Sensitivity Analysis

IV. Simulation Analysis

V. Appendix

Project Overview

Project Overview

Purpose

- Per Title 24, § 8510, stress testing of the Pennsylvania Public School Employees' Retirement System ("System") is needed for fiscal years beginning after June 30, 2022, and should include the following:
 - **Scenario analysis:** deterministic projections based on the recommendations of the Society of Actuaries' Blue Ribbon Panel
 - **Sensitivity analysis:** impact of changes in the actuarially assumed rate of return on the System liabilities
 - **Simulation analysis:** stochastic projections covering a wide range of potential future outcomes, simulating the volatility of annual investment returns

Summary of Results

- Funded ratio is expected to grow from 62% to above 68% over the next 2 years
- Contributions are expected to slightly increase for 10+ years, reducing as bases fully amortize and as the System reaches 100% funding
- The results show a wide range of possible outcomes over the next 30 years. Contribution policy and investment policy should be monitored as System experience unfolds

Scenario Analysis

Deterministic Projections

Scenario	Methodology
Baseline	Asset return for the next 30 years is equal to the System's expected return assumption (7%)
Excess Return	Asset return for the next 20 years is 2% higher than the System's expected return assumption (9%), and for the following 10 years is equal to the System's expected return assumption (7%)
Low Return	Asset return for the next 20 years is 2% lower than the System's expected return assumption (5%), and for the following 10 years is equal to the System's expected return assumption (7%)
Low Contribution	Contributions for the next 20 years are 80% of the actuarially-determined contributions, and for the following 10 years are equal to the full actuarially-determined contributions

- Statistics shown are the ones outlined in Title 24, § 8510:
 - “assets, liabilities, unfunded actuarial accrued liabilities, the change in unfunded actuarial accrued liabilities, employer contributions, benefit payments, service costs, payroll and calculations of the ratios of assets to liabilities, employer contributions to payroll and operating cash flow to assets”

Detailed Stress Test - Baseline Scenario

Fiscal Year Ending	Asset Return	Actuarial Liability	Gross Normal Cost	Market Value of Assets	Actuarial Value of Assets	Unfunded AL (MVA)	Change in Unfunded AL (MVA)	Funded Ratio (MVA)	Payroll	Employer Contributions	Employer Contributions (% of Payroll)	Benefit Payments	Net Outflow (BP - Total Cont)

Summary of Scenario Analysis Results

Scenario	5 Years		10 Years		30 Years	
	Cumulative Employer Contributions* (\$ Billions)	Funded Ratio (MVA)	Cumulative Employer Contributions* (\$ Billions)	Funded Ratio (MVA)	Cumulative Employer Contributions* (\$ Billions)	Funded Ratio (MVA)
Baseline	\$26.5	71.5%	\$56.5	84.7%	\$91.2	99.5%
Excess Return	\$26.4	78.7%	\$54.9	102.0%	\$76.8	194.7%
Low Return	\$26.6	64.8%	\$57.9	70.0%	\$142.7	74.8%
Low Contribution	\$21.5	66.9%	\$47.6	75.3%	\$108.8	93.3%

*Employer Contributions accumulated beginning as of 7/1/2023

Key Takeaways

- Contributions are slightly impacted by returns in the short term, but the impact is large over the course of 30 years
- Funded ratio is heavily impacted by both contributions and return, and a wide range of outcomes is displayed at the end of 30 years

Sensitivity Analysis

Estimated Net Pension Liability with Changes in the Discount Rate

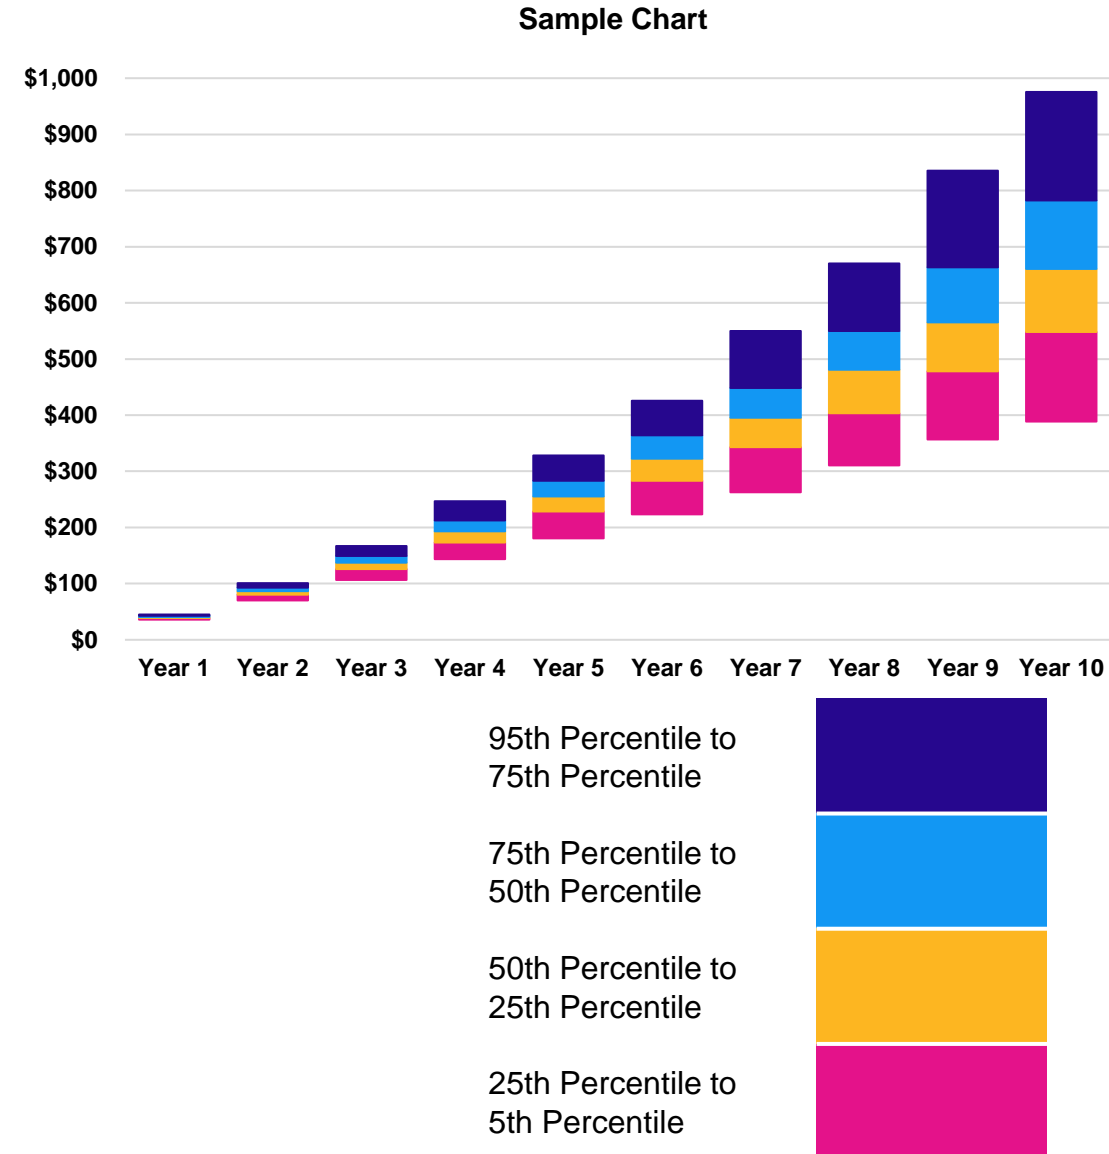

(\$ Billions)	1% Decrease (6.00%)	Current Discount Rate (7.00%)	1% Increase (8.00%)
Estimated Net Pension Liability at 6/30/2023*	\$57.3	\$44.1	\$33.0

*Estimated June 30, 2023 GASB 67 Net Pension Liability equals the Total Pension Liability minus the Fiduciary Net Position assuming a June 30, 2023 valuation date. Please refer to the June 30, 2023 GASB 67 report for the actual June 30, 2023 GASB 67 Net Pension Liability.

Simulation Analysis

What is Stochastic Modeling?

- Extension of the actuarial valuation process
- 999 actuarial valuations simulations are performed for each of the 30 forecast years. Each of the 999 trials represents a different path that portfolio returns could take over 30 years in different economic and capital market environments
- Results are summarized and ranked for each metric
- Results are shown in bar graphs (see exhibit to the right) that display results from the highest value to the lowest value. The 95th percentile result represents the 950th highest value out of 999 values and the 5th percentile represents the 50th highest value. In evaluating a result:
 - For cost metrics, the 95th percentile, represented as pink, is relatively unfavorable
 - For asset and funded percent metrics, the 95th percentile, represented as purple, is relatively favorable
- Results shown are as of 6/30 of the displayed year

Asset/Liability Projection Stochastic Results

Market Value of Assets and Actuarial Liability Funded Ratio – Short-Term Risk

- The System is ~62% funded on a market value of assets basis as of 6/30/2023
- Over the next 2 years, economic factors can lead to a large range of possible funded ratios, ranging from just below 55% at the 5th percentile to over 80% at the 95th percentile
 - There is a one-in-twenty chance the funded ratio will fall to 55% or lower, and another one-in-twenty chance it will be above 80%

Asset/Liability Projection Stochastic Results

Market Value of Assets and Actuarial Liability Funded Ratio – Long-Term Trends

Asset/Liability Projection Stochastic Results

Market Value of Assets and Actuarial Liability Funded Ratio

- At the median result, the System reaches full funding at 6/30/2036
- In the most favorable scenarios, the funded ratio increases significantly. Changes to funding policy and investment policy in future years would impact the trajectory of these results
- In the least favorable scenarios (5th percentile), the funded ratio is approximately 42% in the long term

	2023	2028	2033	2038	2043	2048	2053
95th Percentile	62.1%	101.2%	134.3%	174.7%	227.1%	300.7%	410.6%
75th Percentile	62.1%	85.6%	108.1%	127.7%	147.6%	175.8%	212.1%
50th Percentile	62.1%	76.1%	90.5%	103.2%	108.9%	115.7%	126.5%
25th Percentile	62.1%	67.4%	74.8%	82.0%	80.6%	77.9%	77.8%
5th Percentile	62.1%	54.3%	56.6%	57.6%	50.5%	43.3%	42.0%

Asset/Liability Projection Stochastic Results

Employer Contribution Amount (\$ Billions)

Asset/Liability Projection Stochastic Results

Employer Contribution (Percentage of Payroll)

Asset/Liability Projection Stochastic Results

Employer Contributions

- Large base from the Act 120 fresh start is expected to be fully amortized by 2036, causing a large decrease in contributions
- When the System is fully funded on an actuarial value of assets basis, contributions decrease as there is little to no unfunded liability to amortize
- Employer contributions reflect the Act 120 “floor” of the employer normal cost rate

(\$ Billions)	2023	2028	2033	2038	2043	2048	2053
95th Percentile	\$5.2	\$5.8	\$7.5	\$5.1	\$4.8	\$6.0	\$7.1

5th Percentile	36.2%	32.5%	26.6%	3.0%	1.9%	1.1%	0.8%

Asset/Liability Projection Stochastic Results

Net Outflow Analysis: (Benefit Payments less Contributions) / Market Value of Assets

Asset/Liability Projection Stochastic Results

Net Outflow Analysis: (Benefit Payments less Contributions) / Market Value of Assets

- Assets are expected to return 7% nominal and 4.5% real (assuming 2.5% inflation)
- As long as net outflow is less than 4.5%, then on an expected basis the System's assets should be adequate to earn enough interest to fund the gap between contributions and benefit payments and maintain purchasing power
- At the median, the net outflow stays near 2% before jumping up in 2036 because of the decrease in contributions. The net outflow decreases towards the end of the 30-year projection period as expected benefit payments reduce and contributions level out

	2023	2028	2033	2038	2043	2048	2053
95th Percentile	1.6%	2.4%	2.8%	6.9%	9.7%	10.0%	8.3%
75th Percentile	1.6%	2.1%	2.3%	5.6%	7.4%	6.8%	5.6%
50th Percentile	1.6%	1.9%	2.0%	4.9%	6.0%	5.3%	4.1%

5th Percentile	1.6%	1.6%	1.0%	3.4%	3.2%	2.4%	1.3%

Summary of Stochastic Results

Portfolio Metrics			Financial Metrics						Expected Date of Full Funding
			30-Year Funding Ratio		30-Year PV of Employer Contributions* (\$ Billions)		30-Year Total Employer Contributions* (\$ Billions)		
30-Year Geometric Return	30-Year Std. Dev.	Sharpe Ratio	Median	5 th Percentile	Median	95 th Percentile	Median	95 th Percentile	
7.4%	8.7%	0.57	126.5%	42.0%	\$49.0	\$73.3	\$82.3	\$178.4	6/30/2036

*Employer Contributions accumulated beginning as of 7/1/2023

Key Takeaways

- Funded ratio is expected to gradually increase over the course of 30 years, with a 5th percentile downside near 42%
- Contributions vary greatly with asset performance, but large decreases are expected in 2036
- Net outflow increases in 2036, so that inflation-adjusted value of System assets reduces from 2037 to 2051, then is expected to grow again in real terms after benefit payments begin to reduce and contributions level out

Appendix

Title 24 | § 8510. Stress Test of System

- A. General rule: The board shall conduct an annual stress test of the system and submit the results of the stress test to the Governor, the General Assembly and the Independent Fiscal Office no later than January 1 of each year. The stress test shall include a scenario analysis, simulation analysis and sensitivity analysis. The board shall disclose in the report of the stress test results which industry standards were used and whether any changes to industry standards have been made.
- B. Report by Independent Fiscal Office.--No later than March 1 of each year, the Independent Fiscal Office shall produce a report summarizing the results of the stress test, including a calculation of the ratio of projected employer pension contributions to projected State revenues under a scenario analysis.
- C. Definitions.--As used in this section, the following words and phrases shall have the meanings given to them in this subsection unless the context clearly indicates otherwise:

"Scenario analysis." Projections of assets, liabilities, unfunded actuarial accrued liabilities, the change in unfunded actuarial accrued liabilities, employer contributions, benefit payments, service costs, payroll and calculations of the ratios of assets to liabilities, employer contributions to payroll and operating cash flow to assets in sufficient number as determined prudent by the board as informed by recognized industry standards.

"Sensitivity analysis." The following:

1. Estimates of the total normal cost and employer normal cost for new employees, calculated using various investment return assumptions in sufficient number as determined prudent by the board as informed by recognized industry standards.
2. Estimates of the unfunded actuarial accrued liability and unfunded liability, calculated using various annual assumed rates of return in sufficient number as determined prudent by the board as informed by recognized industry standards.

"Simulation analysis." Projections of the range of required employer contributions for each of the next 20 years, based on analysis that simulates the volatility of annual investment returns above and below the assumed rate of return, applying methodology determined prudent by the board as informed by recognized industry standards.

(Nov. 25, 2020, P.L.1237, No.128, eff. 60 days)

2020 Amendment. Act 128 added section 8510. Section 7(1) of Act 128 provided that the addition of section 8510 shall apply to fiscal years beginning after June 30, 2022.

Portfolio Analysis

Current Long-Term Policy

- Return, standard deviation, and Sharpe Ratio statistics are calculated using Buck's October 2023 Capital Market Assumptions
- Asset allocation is based on the allocation plan as of June 30, 2022, shown in the PSERS Investment Report

Asset Class/Metric	Asset Allocation Plan
US Large Cap Equity	10.7%
US Small Cap Equity	1.1%

Actuarial Assumptions and Methods

- The projections provided were prepared using the same data, actuarial methods, assumptions, and applicable ASOPs and disclosures that were used for the June 30, 2023 actuarial valuation, found in the December 14, 2023 Board presentation, and the following assumptions for future valuations:
 - The active workforce size is assumed to remain constant; and
 - Future new employees have similar characteristics (age/gender/salary) to new employees for the period July 1, 2020 through June 30, 2023. Among new school employees hired on or after July 1, 2023, 98% will become Class T-G members, 1% will elect Class T-H membership, and 1% will elect Class DC participation.
- Key assumptions:
 - Expected Rate of Return on Assets: 7.00%
 - Payroll Growth: 3.25%
 - Average Salary Increase: 4.50%
 - Inflation: 2.50%
- The projections reflect the ACT 5 risk-sharing provisions for TE/TF/TG/TH members. We caution that the System assets and projected unfunded accrued liability amortization schedules reflect the under/over contribution from the basic member rate resulting from the assumed asset returns, the corresponding System accrued liabilities do not reflect the decrease/increase in the affected members' contribution rates. Stress-testing for future alternative System returns that are different from the assumed 7.00% per annum may also affect the projected System liabilities due to the shared-risk member contributions due to incidence of return of contributions for non-vested members, Option 4 lump sum withdrawals, etc.
- Asset figures reflect actual market asset value of \$72.112 billion as of June 30, 2023.
- The health insurance premium assistance assets and liabilities have been excluded from this analysis.
- Please see the June 30, 2022 actuarial valuation report for all other actuarial assumptions and methods.

Actuarial Certifications

This report was prepared under the supervision of Stuart Schulman, a Fellow of the Society of Actuaries, an Enrolled Actuary, and a Member of the American Academy of Actuaries; and David Driscoll, a Fellow of the Society of Actuaries, an Enrolled Actuary, and a Member of the American Academy of Actuaries, who have met the Qualification Standards of the American Academy of Actuaries to render the actuarial opinion contained herein. We are available to answer any questions on the material in this report or to provide explanations or further details as appropriate. We are not aware of any direct or material indirect financial interest or relationship, including investments or other services that could create a conflict of interest, or that would impair or appear to impair the objectivity of our work.

Future actuarial measurements may differ significantly from current measurements due to plan experience differing from that anticipated by the economic and demographic assumptions, increases or decreases expected as part of the natural operation of the methodology used for these measurements, and changes in plan provisions or applicable law. Because of limited scope, Buck performed no analysis of the potential range of such future differences outside of what is presented in this report.

Additional Information

The investment products and strategies in this proposal are for presentation purposes only. Any dissemination, distribution, or duplication of this presentation or any of its contents without prior written consent from Buck Global, LLC is strictly prohibited.

The asset-allocation structures in this presentation are hypothetical and do not represent the investment performance or the actual accounts of any investors (“Hypothetical Portfolios”). The performance of Hypothetical Portfolios should be considered hypothetical results (“Hypothetical Results”). Hypothetical Portfolios and Hypothetical Results do not reflect actual investment or performance by an Investment Product or investor, or a recommendation on the part of Buck to any particular investor; nor should they be considered as indicative of the skills of Buck or any Investment Adviser. Hypothetical Portfolios and Hypothetical Results are provided for illustrative purposes only and do not guarantee past or future investment results. Hypothetical Results are based on expectations, and do not reflect the impact that economic and market factors may have on investment decisions by an Investment Manager. Differences between the hypothetical assumptions and an actual investment are material and may decrease substantially the illustration value of any Hypothetical Results. Hypothetical Portfolios may not take into account the goals, risk tolerance, and circumstances of each investor. An investment decision should not be based on Hypothetical Results.

Buck’s Capital Market assumptions are based on a model developed by Conning and Company called “GEMS.” At the beginning of the year (or more frequently), Buck determines a set of “standard” capital market assumptions based on the output from the GEMS model. The model incorporates historical data (back to inception of various indices), and uses a factor model to forecast future values for all relevant asset classes. GEMS captures the real-life fact that means volatilities and correlations are determined dynamically and can change over time. This means that expected returns over, say, a 10-year horizon may not equal those over a 20-year horizon. Based on a Monte Carlo-type analysis, we derive sample means, standard deviations and correlations for reporting purposes. GEMS can model the economies of the USA, UK, Switzerland, Canada and Germany in an internally consistent manner, and can therefore capture forecasted currency effects and interest disparities between and among the Dollar, Pound, Swiss Franc, Canadian Dollar and Euro.

All information that is obtained from external sources cannot be guaranteed but is provided by those who have been proven to be credible, reliable, and recognizable.
